Question

Let the algebraic sum of the perpendicular distances from the points (2,0),(0,2) and (1,1) to a variable straight line be zero; then the line passes through a fixed point whose coordinates are _____.

Solution

The normal form of a line is:

$$\mathbf{n}^T\mathbf{x} = c \tag{1}$$

The perpendicular distance of a point from a line is:

$$\frac{|\mathbf{n}^T\mathbf{x} - c|}{||n||} \tag{2}$$

It is given that the algebraic sum of the perpendicular distances of three points (2,0), (0,2), and (1,1) to a line $\mathbf{n}^T\mathbf{x} = c$ is 0. Therefore:

$$\frac{\mathbf{n}^T x_1 - c}{||n||} + \frac{\mathbf{n}^T\mathbf{x}_2 - c}{||n||} + \frac{\mathbf{n}^T\mathbf{x}_3 - c}{||n||} = 0 \tag{3}$$

$$\frac{\mathbf{n}^T(\mathbf{x}_1 + \mathbf{x}_2 + \mathbf{x}_3) - 3c}{||n||} = 0 \tag{4}$$

So, the required point is:

$$\frac{(\mathbf{x}_1 + \mathbf{x}_2 + \mathbf{x}_3)}{3} \tag{5}$$

Substituting the points:

$$\frac{\begin{pmatrix}2\\0\end{pmatrix} + \begin{pmatrix}0\\2\end{pmatrix} + \begin{pmatrix}1\\1\end{pmatrix}}{3} = \tag{6}$$

$$\begin{pmatrix}1\\1\end{pmatrix} \tag{7}$$

Therefore the line passes through the fixed point (1,1).
